Java I/O

1. **Problem Statement:** Write a Java program to copy the contents of a text file (source.txt) to another file (destination.txt) using FileInputStream and FileOutputStream. Ensure the program handles exceptions like FileNotFoundException and IOException.

2. **Problem Statement:** Create a program to read a list of names (one name per line) from a file (names.txt) and write only the names starting with a specific letter (e.g., "A") into another file (filtered_names.txt).

   Requirements:

   - Use FileReader and FileWriter.
   - Ensure proper exception handling and resource management using try-with-resources.

3. **Problem Statement:** Develop a program that asks the user for a list of tasks (e.g., a to-do list) using the Scanner class and saves them to a file (tasks.txt). Then, read back the tasks from the file using BufferedReader and display them on the console.

   Requirements:

   - Use BufferedWriter to save the tasks to the file.
   - Use BufferedReader to read the tasks from the file.

4. **Problem Statement:** Create a Java program to serialize a list of Student objects into a file (students.ser) and then deserialize it to read and display the student details.

   Class Structure for Student:

```
import java.io.Serializable;
public class Student implements Serializable {
        private static final long serialVersionUID = 1L;
        private String name;
        private int rollNumber;
        private double grade;

    // Constructor, Getters, and Setters
}
```

5. **Problem Statement:** Write a program that:
1. Reads employee data (name, id, salary) from a CSV file (employees.csv) using BufferedReader.
2. Creates Employee objects for each record and adds them to a list.
3. Serializes the list of Employee objects to a file (employees.ser).
4. Deserializes the list back and prints all employee details to the console.

Requirements:

- Use BufferedReader for reading the CSV file.
- Implement Serializable in the Employee class.
